

INTERACTIVE MEDICAL TRAINING SYSTEM

Abstract of the disclosure:

5 A computer-based medical training system is provided
which interactively engages the student. The training
system is Web-based and presents the materials being
taught in the format of a patient chart familiar to
10 medical professionals, and containing teaching materials
such as lab reports, diagnostic images and general medical
information not usually found in a case study analysis and
patient chart. In a diagnostic medical imaging embodiment
the student is presented with information on the full
15 spectrum of diagnostic imaging modalities which may be
applied to a given pathology. The training system
maintains the interest of the student by providing
animated graphics of the principles being taught. The
learning of the student is continually validated and
20 reinforced by periodic tests following the teaching of
individual lessons within the course of training.
